

Does your project have performance issues just before go-live?
– Don't you just hate it when that happens?

Do you know what actually takes up most of the time in your application? *On production?*

Profiler

Wouldn't it be great if you could embed a profiler in your production code, *and leave it running?*

With the BeyondTrees C# Profiler, you can;

- Automatically recognizes hierarchy of calls, gives optimization recommendations
- Optimized for ASP.NET (2.0+), output to Log4Net or online
- Microsecond overhead, leave it running on production

```
